

# Climate Change Impacts on Forest Ecosystems in Korea, and Needs of Proactive Adaptation Measures

Lim, Jong-Hwan, Ph.D.  
Korea Forest Research Institute

<http://www.fs.fed.us/pnw/>

Pacific Northwest Oak Communities

# Contents

## Introduction

- Forest and FBD changes in Korea
- Threatening factors to FBD
- Climate change as an emerging threatening factor

## Climate Change Impacts on Korean Forests

- Biodiversity changes: phenology, vegetation shifts
- Disasters and forest pests and insects
- Forest productivity and so on

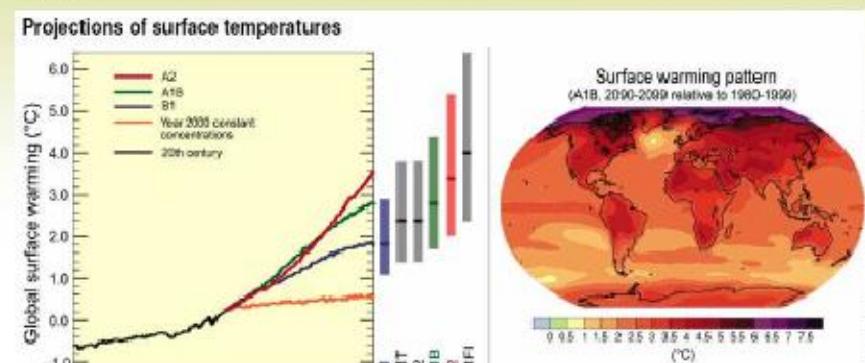

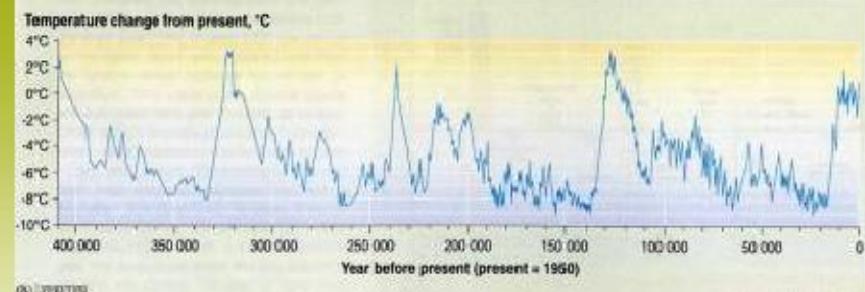

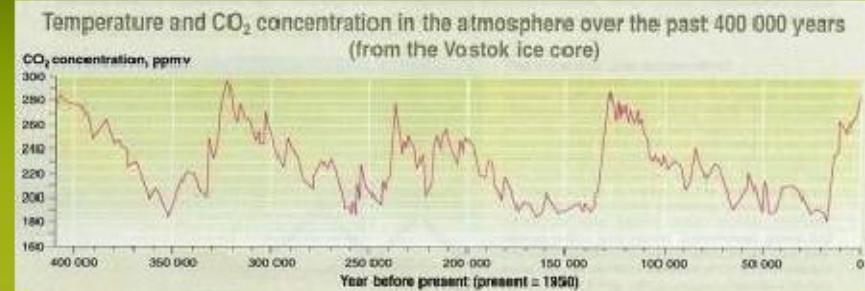

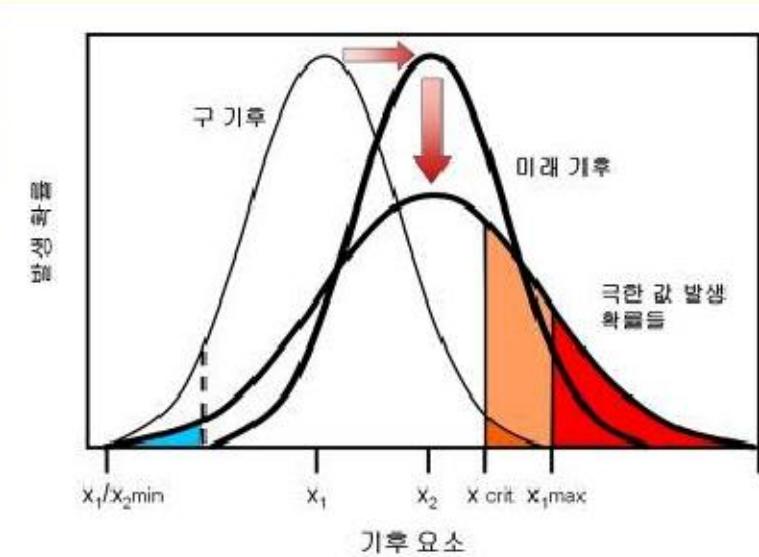

## Adaptation Measures to Climate Change

- Restoration of vulnerable area
- Networking of natural ecosystems

# Climate Change

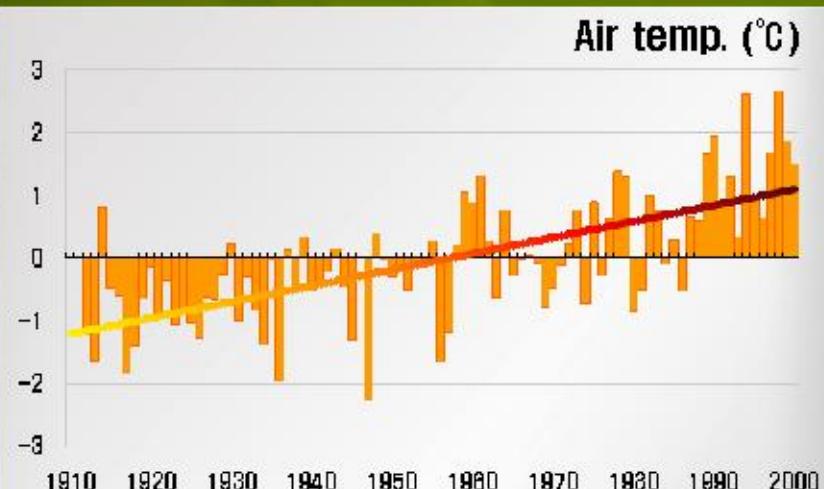

- Global warming and GHG
- Natural vs. Anthropogenic
- Air temp & precipitation changes
  - + Atmospheric CO<sub>2</sub> concentration
  - + Other pollutants

Seasonal pattern change,  
Abnormal extreme events

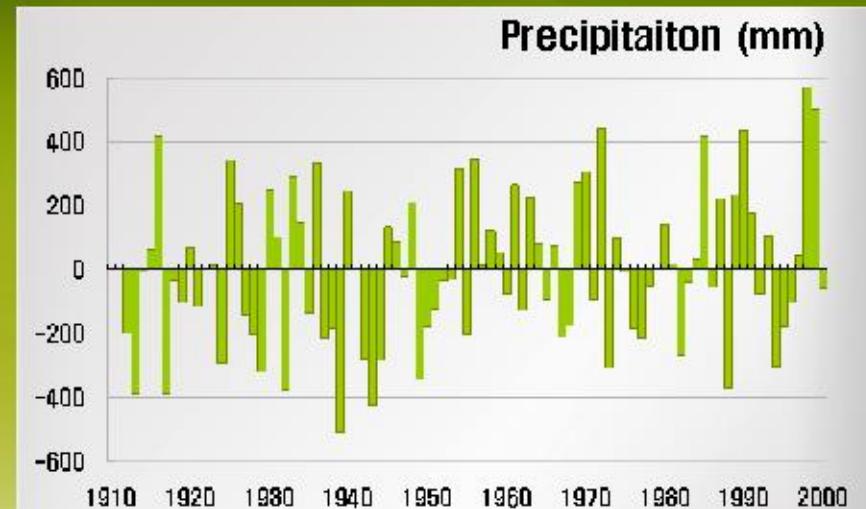

IPCC, 2007

# Climate Change in Korea (1912~2005)

- 1.5°C Increase (winter > summer), urbanization effect: 20-30%
- No. of tropical nights: 1.4 days/yr. Increase

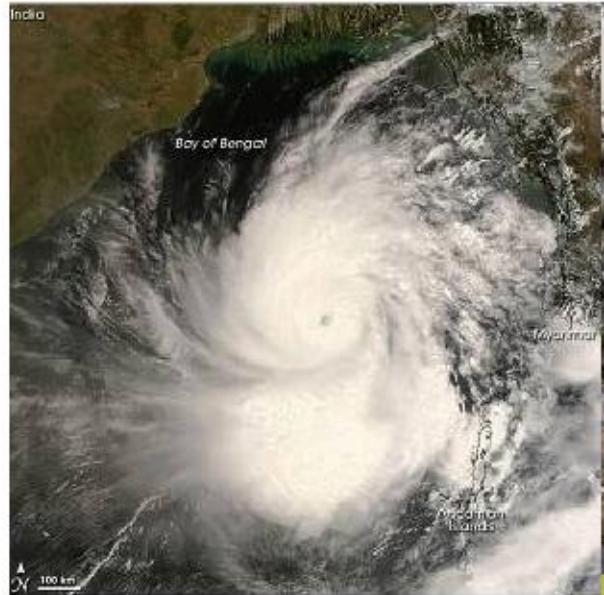

- Decreased rainy days,
- Increased prep. 10%, (summer 18%)
- Increased flood hazards

## Future scenarios

- Temp. increase up to 1.1–6.4°C  
winter > summer
- Precipitation increase  
winter < summer

KMA, 2004

**Cyclone in Myanmar, 2008.5.**

**Hurricane Katrina, 2005.8.**

Drought

Figure 1.1. Area extent of Chaukhamba Glacier, Bolivia, from 1940 to 2005. By 2005, the glacier had separated into three distinct small bodies. The position of the ski hut, which did not exist in 1940, is indicated with a red cross. The skii lift, which had a length of about 800 m in 1940 and about 850 m in 1988, was normally travelled during the summer months (precipitation season in the tropics) and covered a major portion of the glacier, as indicated with a continuous line. The original location of the skii lift in 1940 is indicated with a segmented line in subsequent epochs. After 2004, skiing was no longer possible. Photo credits: Framou and Vincent (2006) and Jordan (1991).

Ice sheet decrease

NEWSIS

Dust wind

Fire

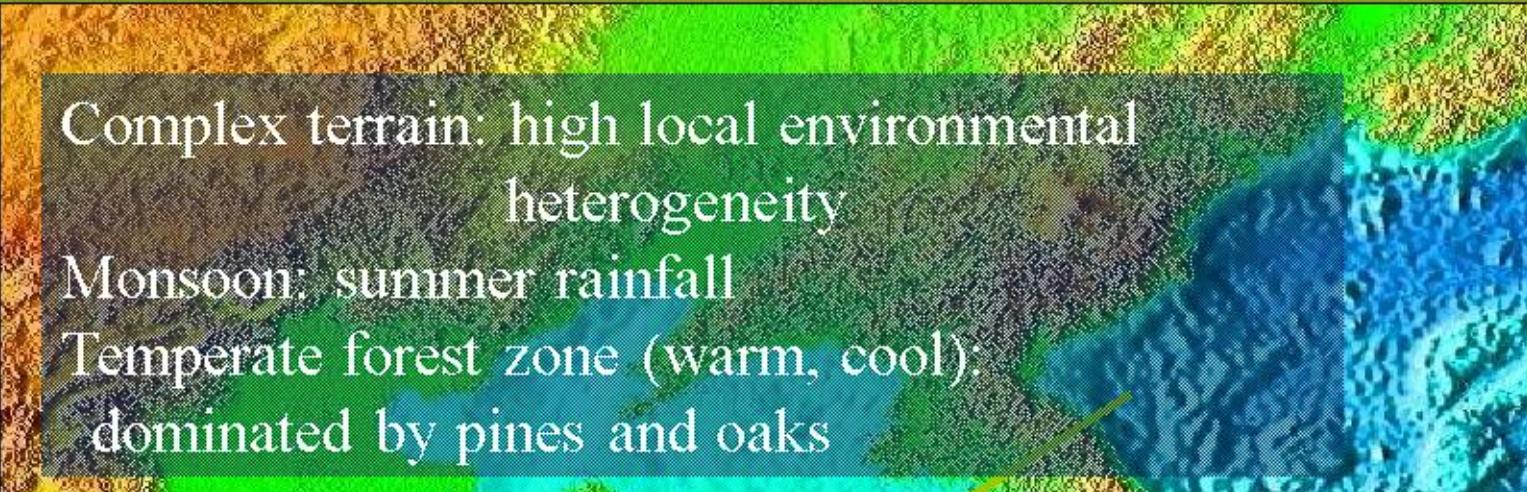

Sea level rise

Ocean acidification

and so on

# Ecological Characteristics of Korea

Complex terrain: high local environmental heterogeneity

Monsoon: summer rainfall

Temperate forest zone (warm, cool):  
dominated by pines and oaks

High population density:  $487/\text{km}^2$

# **Influencing disturbances on forest biodiversity in Korea**

## **1. Short-term natural disturbances**

- a. forest fire
- b. landslide
- c. outbreaks of pest and insects

## **2. Global environmental changes**

- a. air/water pollution: acid rain, dust storm, and so on
- b. global warming

## **3. Human activities**

- a. forest conversion, road construction, forest fragmentation
- b. forestry activity: cutting, planting, silvicultural practices
- c. selective collection of forest byproducts

# Changes of Forest Cover and Major Disturbances

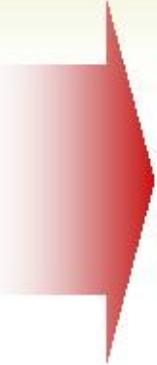

## until 1960s

- Denuded forest area  
(Stock volume : 10m<sup>3</sup>/ha)
- Over-exploitation by human for timber, fuels and foods
- Soil erosion was severe

## 1970s – 1980s

- Recovered by reforestation
- Pine forests dominated (young age)
- Outbreaks of pine insects
- Habitat destruction and pollution

## 1990s - present

- Oaks and Pine forests dominated (ages 20-40s, mostly)
- Climate-related natural disasters, IAS
- Reduced human interactions
- Selective exploitation of forest products

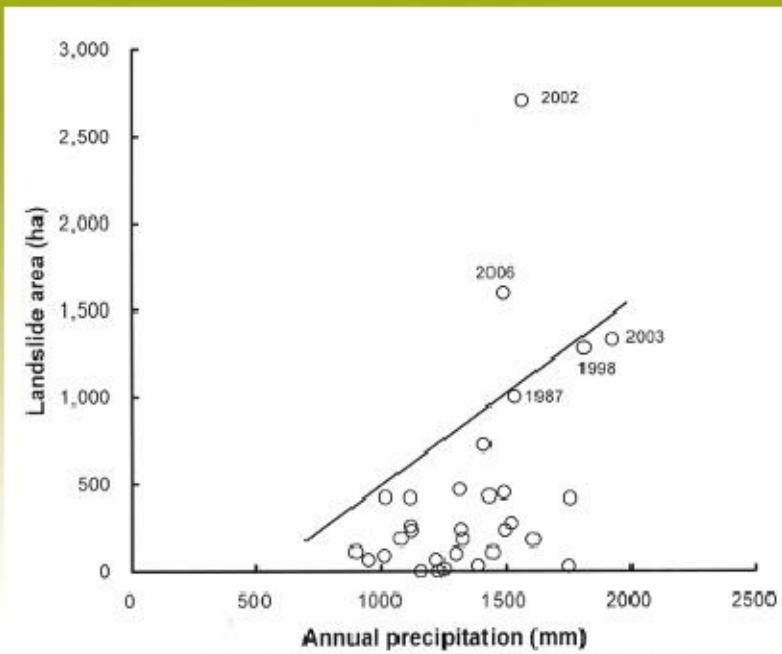

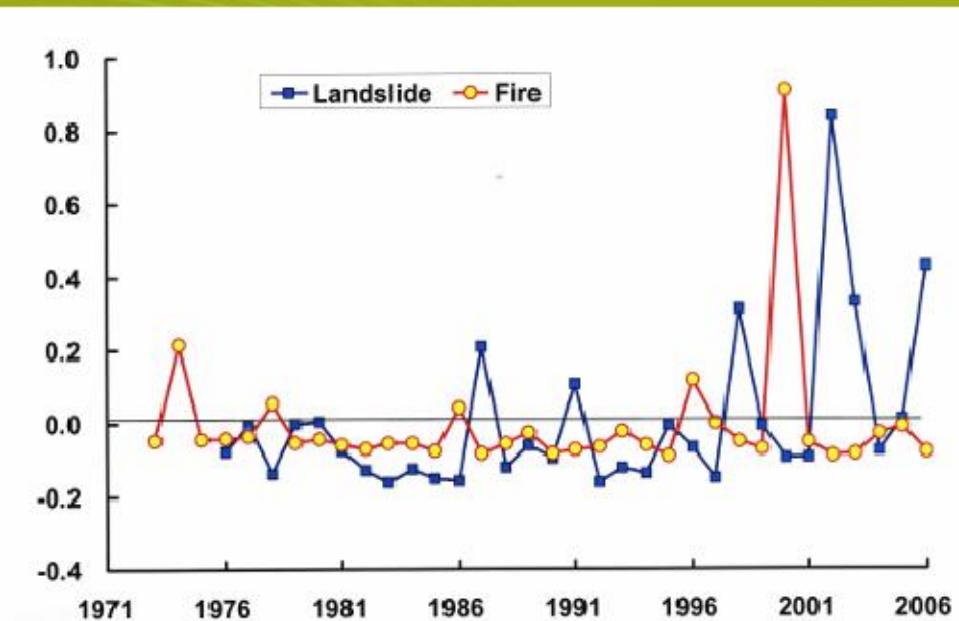

# **How Korean forest biodiversity could have been recovered?**

- Success of the powerful “Forest Rehabilitation Project” in 1970s leaded by government
- Poverty elimination and changes in fuel sources from biofuels to other sources
- Effective establishment and management of various Forest PAs
- Paradigm shift in forest management: SFM
- ....

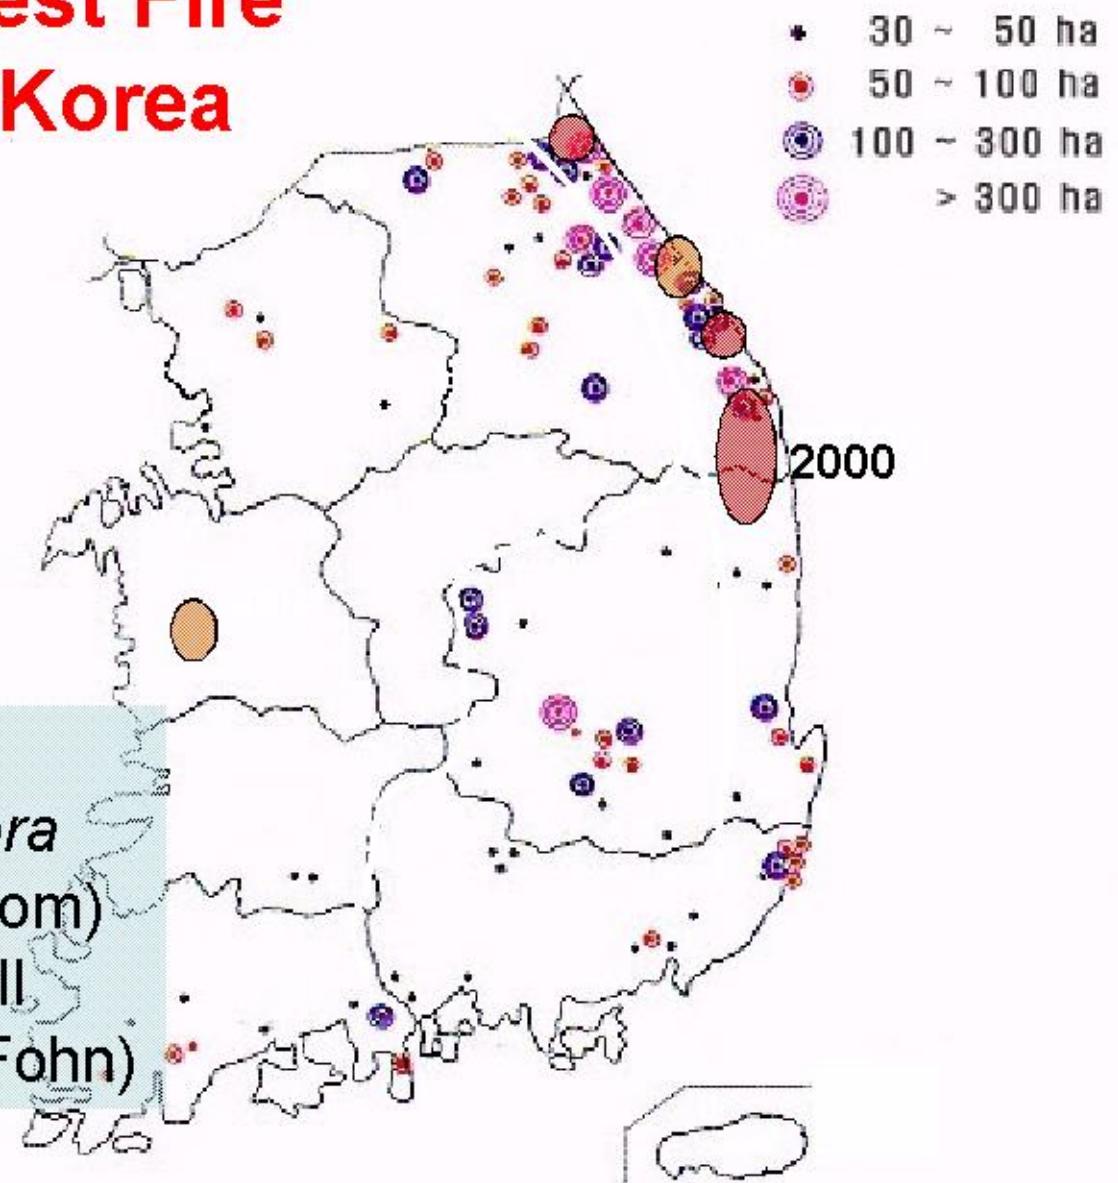

# Recent Increase of Forest Disasters by Extreme Climatic Events

- Abnormal climatic events: global warming?
- Increased damages of forest resources

## Forest Fire in Korea

East-coastal ecoregion

- Forest type: *P. densiflora*  
(produce pine mushroom)
- In spring: lowest rainfall  
and strong dry wind (Fohn)

# Post-Wildfire Landslide Hazards

- For 26 hours during 2002.8.31 – 9.1, localized downpour :
- Total rainfall: 897.5mm
- The maximum hourly rainfall : 98mm(Gangneung city)
- The daily rainfall : 870mm(2.9 times more than 305mm in 1921)

Destroyed the same area in 2002 damaged by fire in 2000

## In summary, in Korea

### **FBD Conservation Activities were Successful**

- Forest rehabilitation and restoration
- Conservation by various types Forest PA:  
complement each other
- Sustainable forest management: various ecosystem services

### **Threatening Factors to Biodiversity are Changing**

- Far past: overexploitation, denudation of forests
- Before 1990: land-use change, habitat destruction and fragmentation, pollution
- Recent and future: global warming, selective exploitation and reduced human-nature interaction

# Ecosystem Services: Forest/Mountains

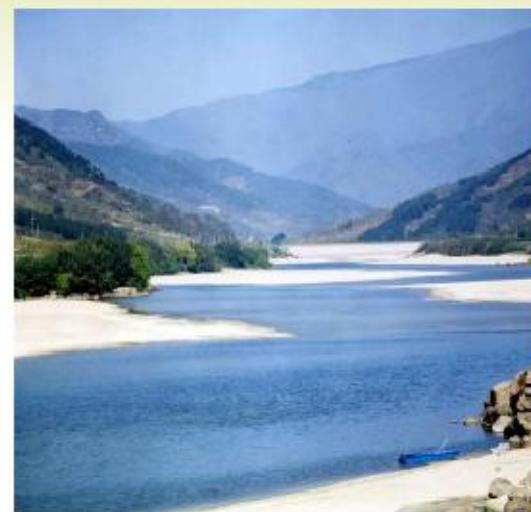

**1. Biodiversity**

**2. Fresh Water**

**3. Protection**

## 4. Resource Extraction

## 5. Carbon storage

## 6. Tourism

## Global Warming Effects on Forest Ecosystem

- Timing of biological events (Phenology)
- Species distribution ranges
- Frequency and intensity of outbreaks of pests and diseases
- Forest disasters: fire and landslide
- Structure and function of ecosystem

**Forests stores lots of carbon and interact with atmosphere**

- Stores 80% of C in terrestrial ecosystem and 40% of soil C

**Trees has long life-span**

- Cumulative risks of extreme climatic events

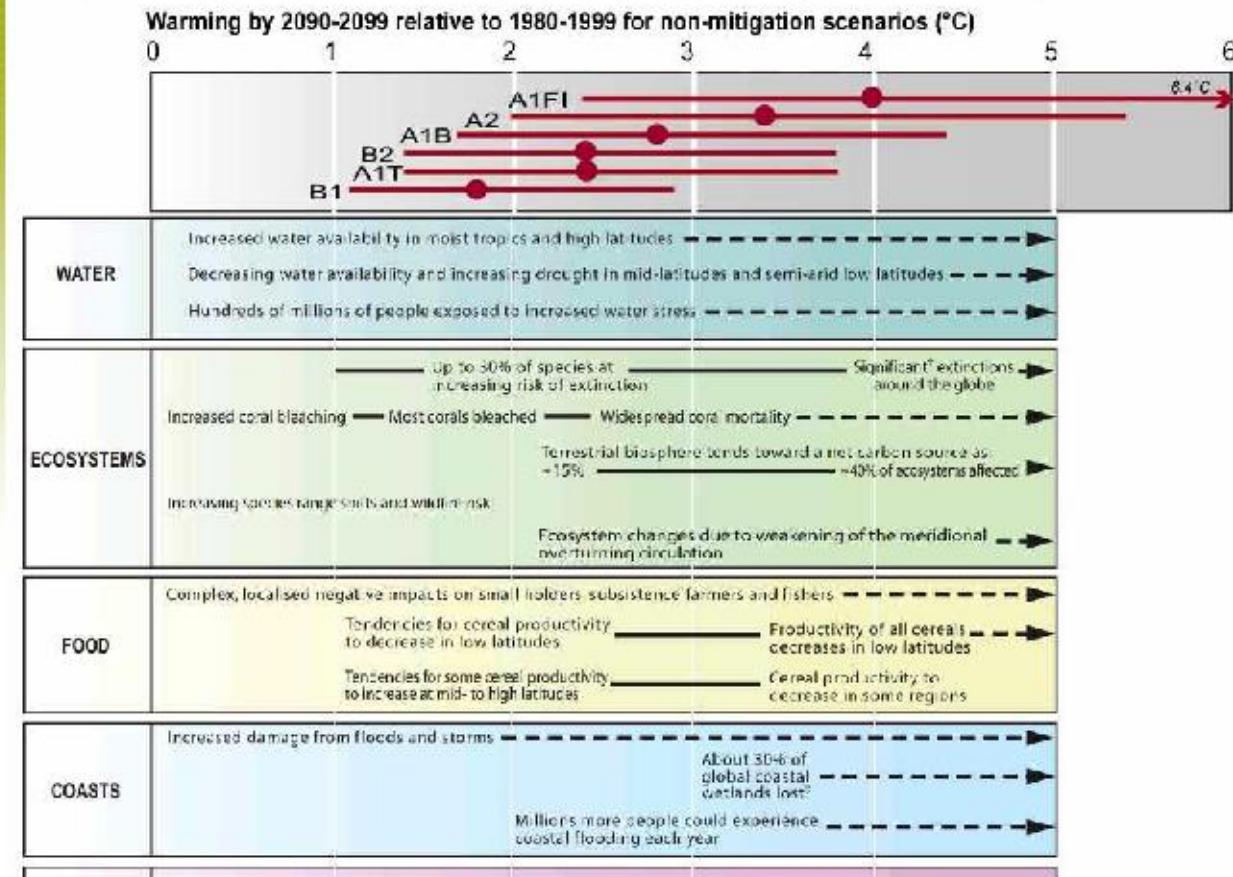

***Climate Change Adaptation is Urgent!!***

# 기후변화의 영향

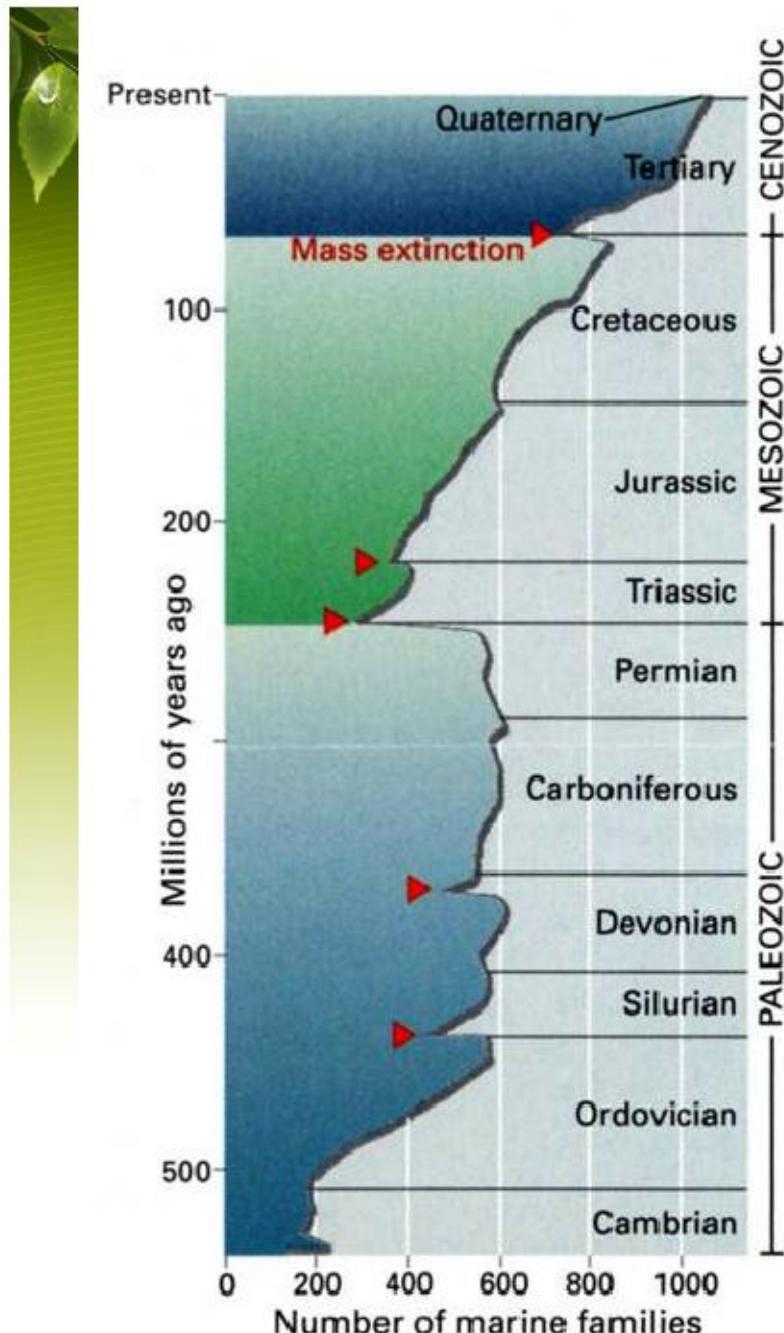

■ 1 million species will be endangered in 2100 (CBD, 2007)

In 50 years, 15-37% of species will be endangered by single factor of climate change (more than 1/4 of mammals, 1/3 of amphibians, 1/10 of birds)

## Examples of impacts associated with projected global average surface warming

Golden frog, Panama

## Rapid extinction, Slow recoveries

An estimated 99% of all sp. that ever lived are extinct.

Recovery took millions of years.

Are we in the another wave of sixth extinction?

In Tertiary era, species increasing rate > extinction rate. However, recently extinction rate has rapidly increased by anthropogenic causes including popn. Increase, deforestation, industrialisation, pollution, overhunting and so on.

Endangered sp. : mammals 24%,  
birds 12%

Extinct sp.: mammals 87, birds 131  
(CBD, 2001)

after Erwin et al.(1987)

# Phenology

- changes in the timing of seasonal activities include leaf burst, flowering, emergence of frogs and insects, breeding of birds, and so on.

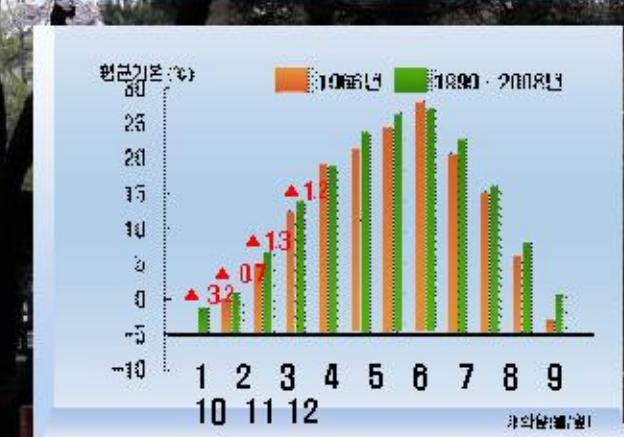

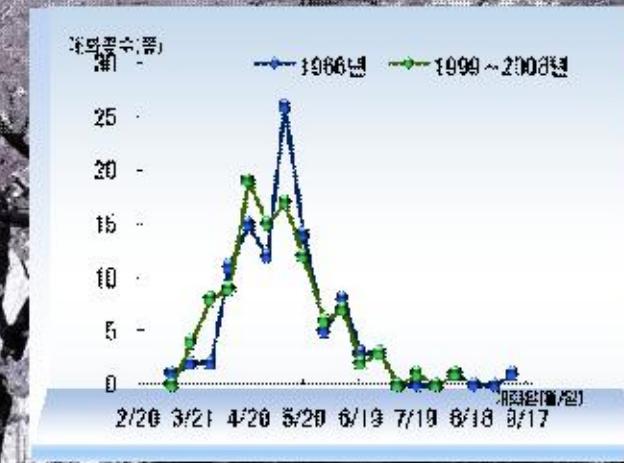

- Leafing time
- Flowering time

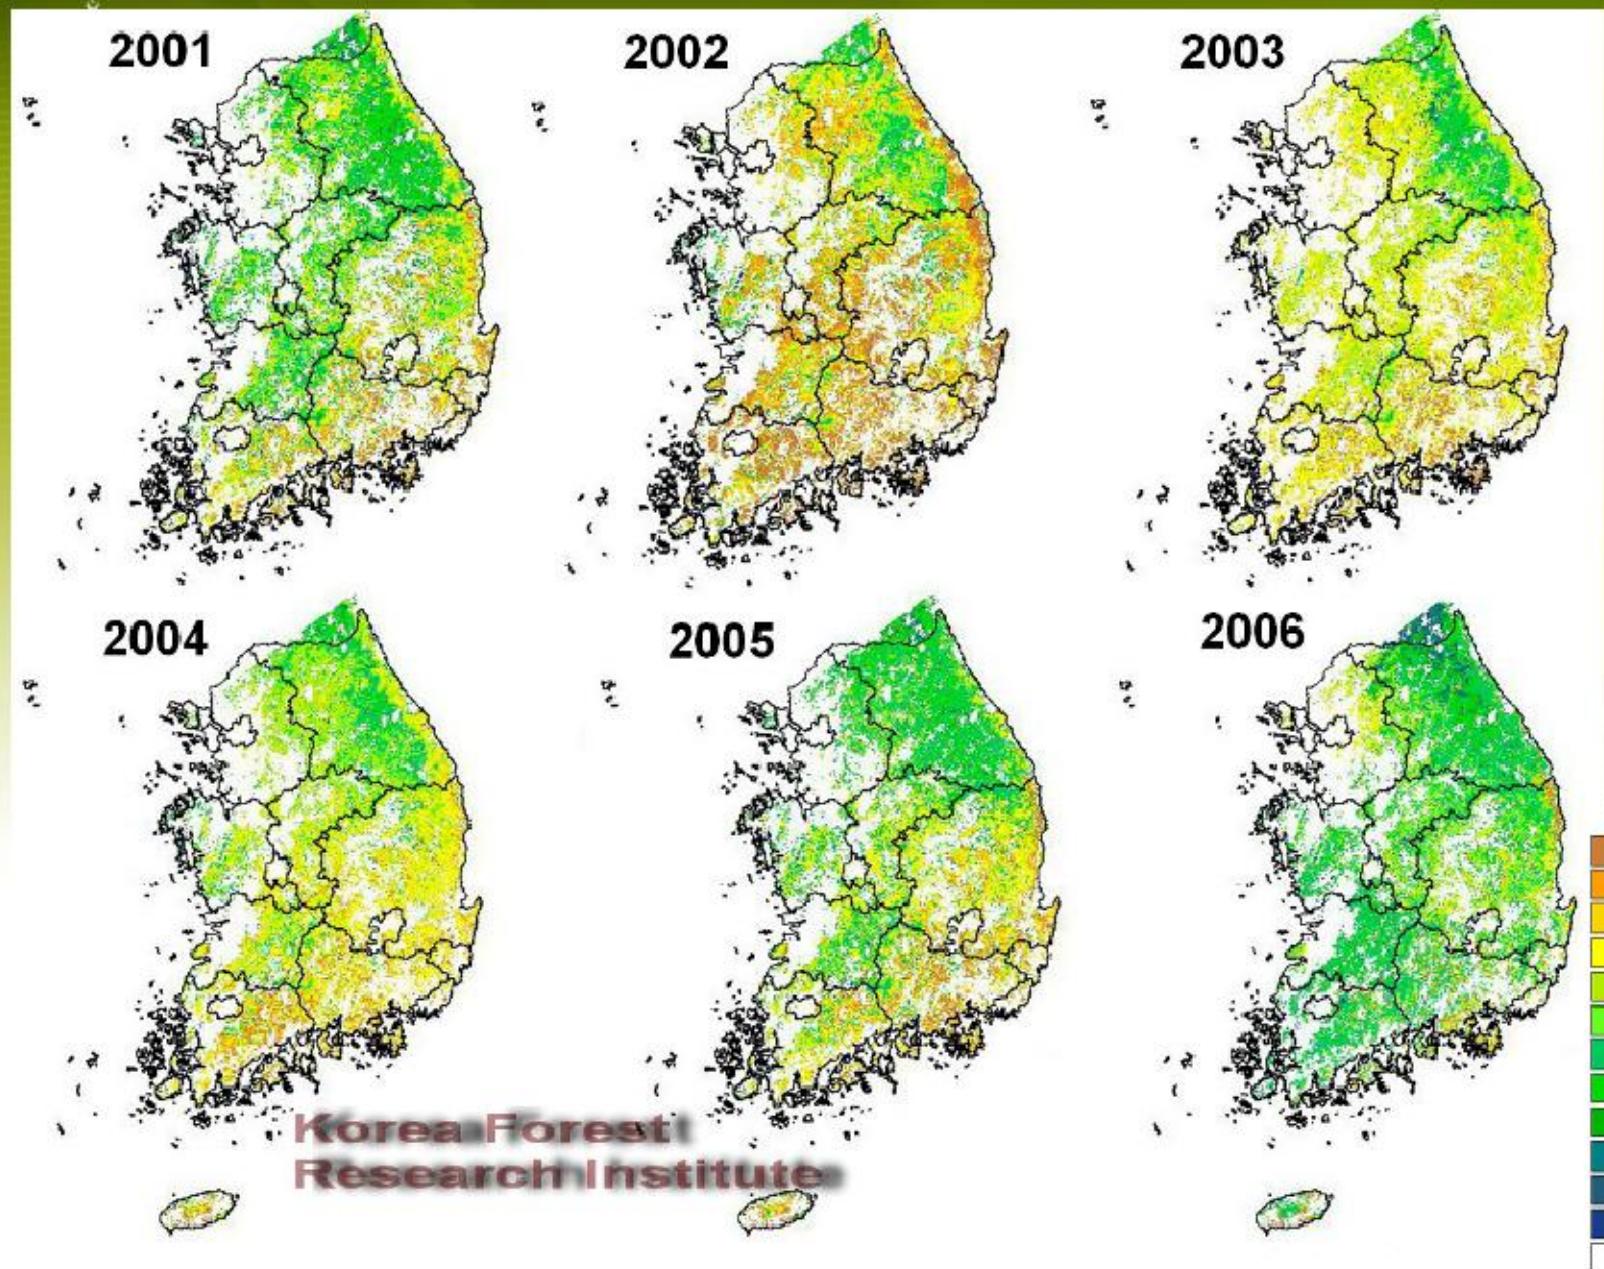

1996년(0) 1997년(3.1) 1998년(9.7) 1999년(7.5) 2000년(2.9)

2001년(6.0) 2002년(9.3) 2003년(6.7) 2004년(6.9)

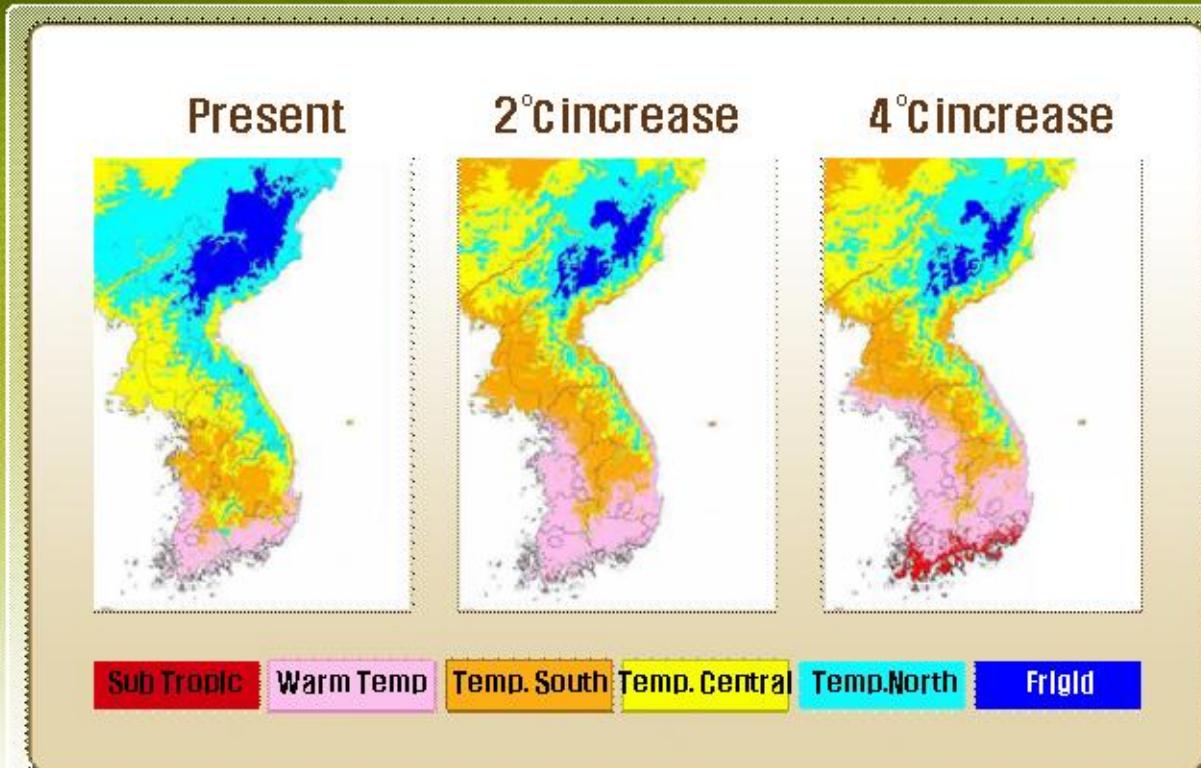

2005년(5.2) 2006년(3.8) 2007년(5.5) 2008년(8.4)

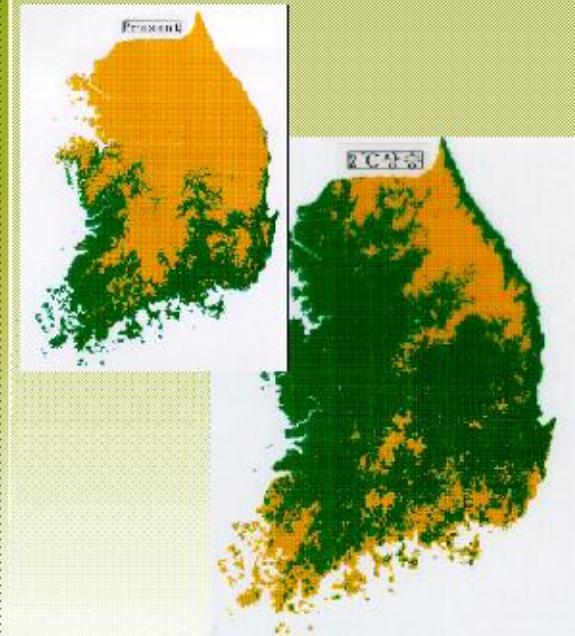

# Maps of leafing date changes

# Vegetation Zone Shift

Potential Distribution Zone  
of *Camellia japonica*

- Fast change of environments
  - gap with historic tree species movement
- Other problems
  - habitat fragmentation: urban, roads, agricultural fields
  - pollutions

- Mountain island
  - biodiversity loss
- Distribution range shift
  - suitable planting sp. change

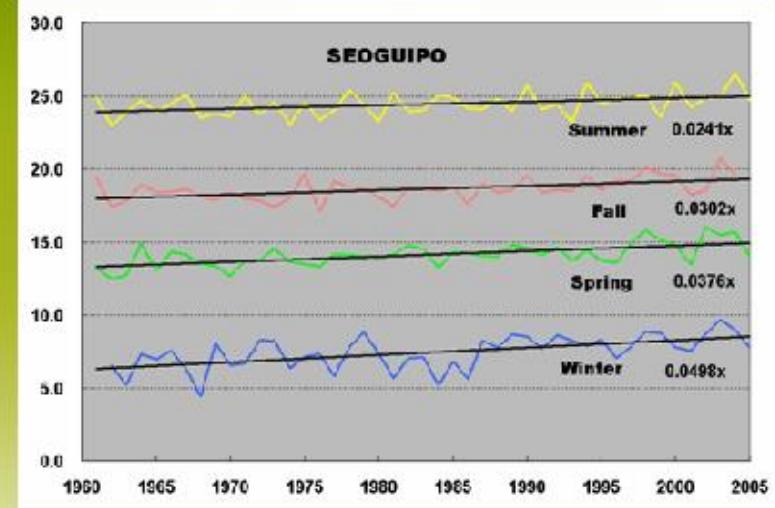

Alpine vegetation is one of the most vulnerable biota to climate change

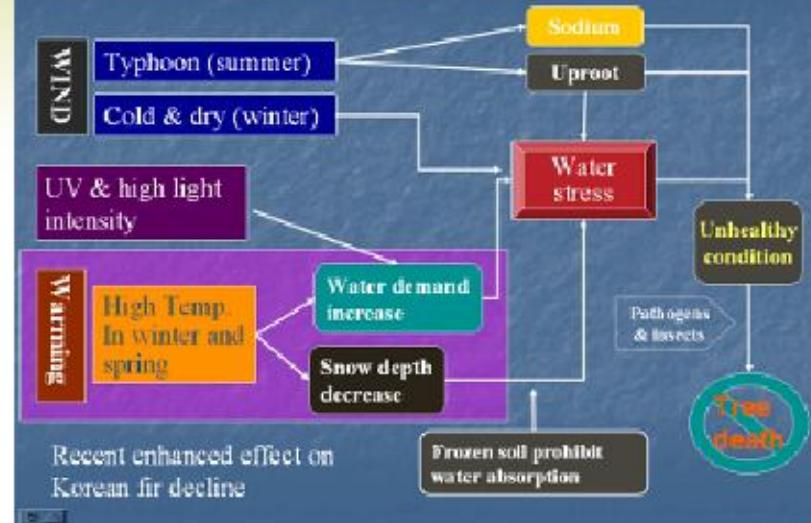

# Vulnerable ecosystem: alpine/subalpine forest

- **Korean fir in Mt. Halla**
  - recent dieback and decline is caused by warming in winter season

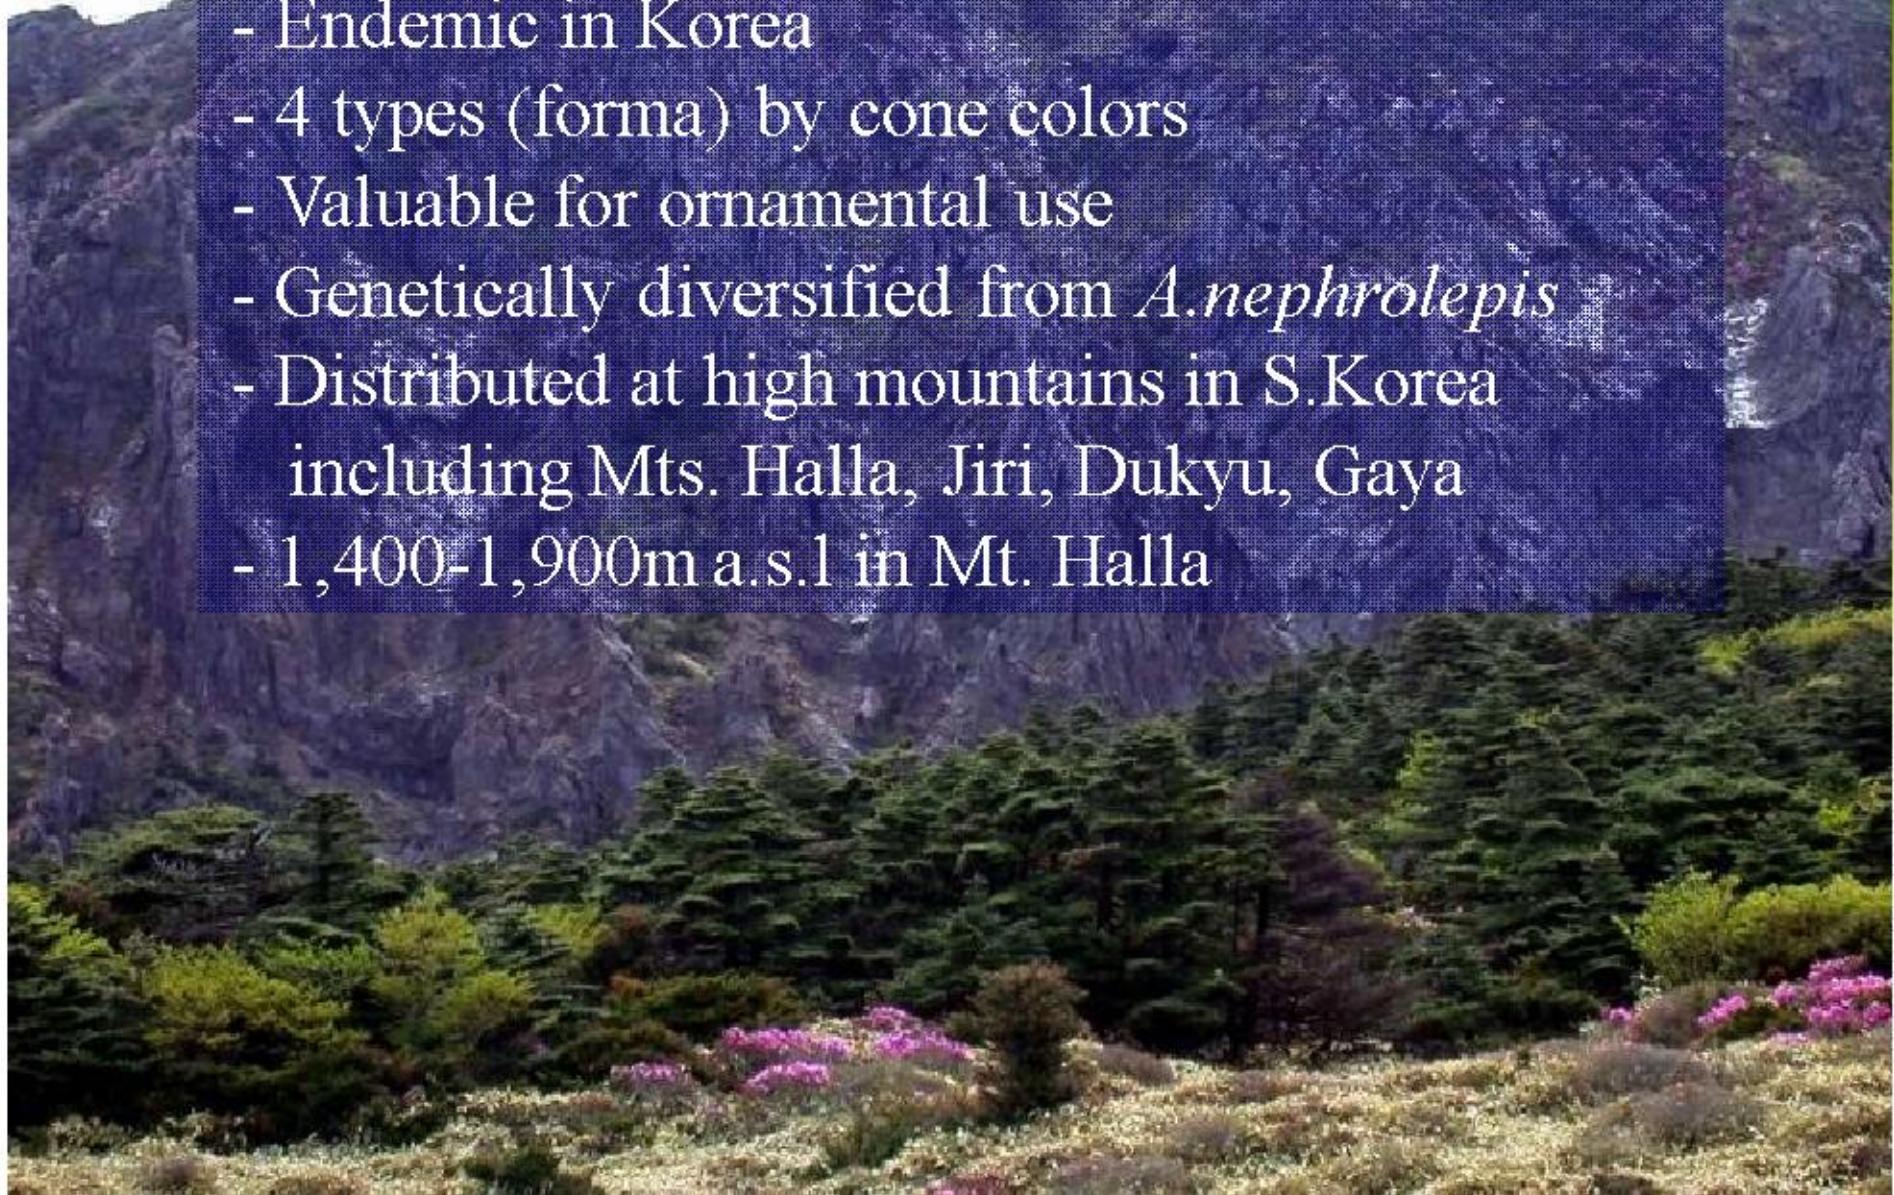

## Mechanism of Korean fir decline

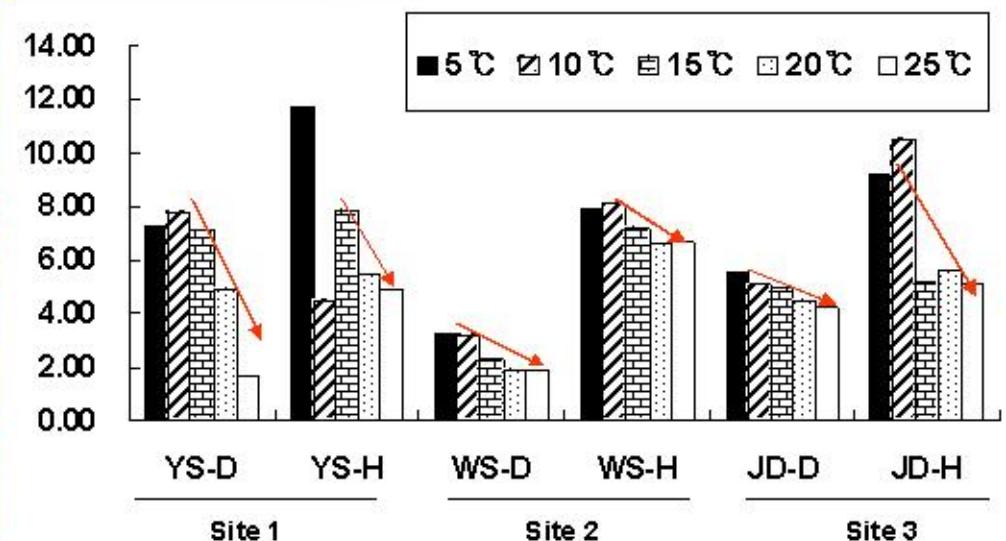

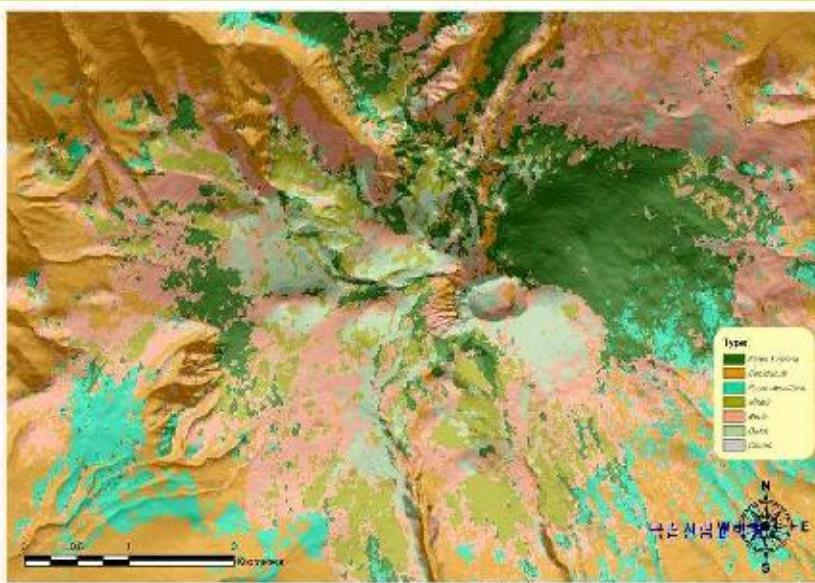

# Korean fir (*Abies koreana*)

- Endemic in Korea
- 4 types (forma) by cone colors
- Valuable for ornamental use
- Genetically diversified from *A. nephrolepis*
- Distributed at high mountains in S.Korea  
including Mts. Halla, Jiri, Dukyu, Gaya
- 1,400-1,900m a.s.l in Mt. Halla

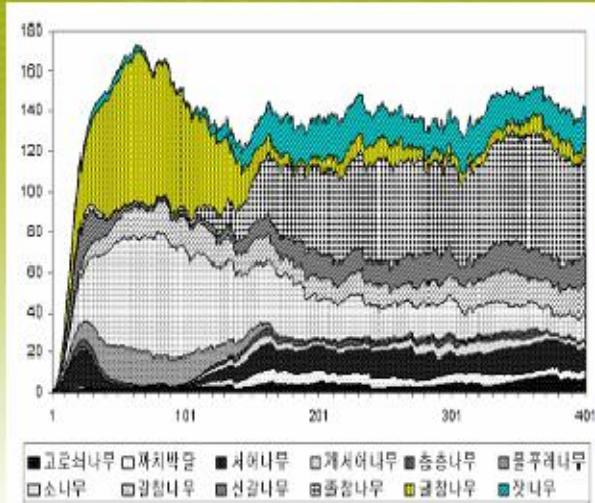

High temp. in winter is stressful, physiologically.  
Mortality was increased by winter warming

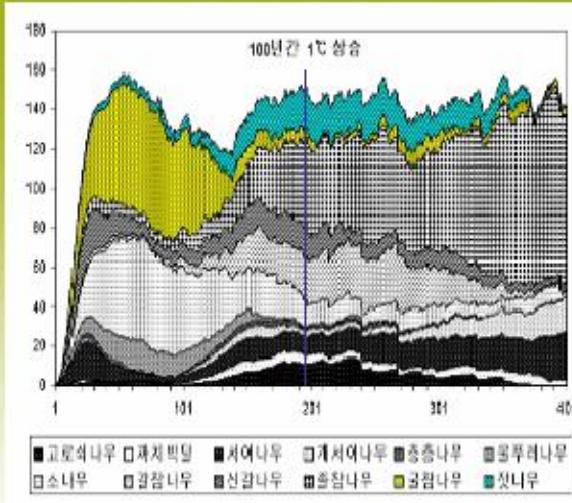

# Forest Community and Productivity Change

## Simulation for Central Temperate Forest Zone

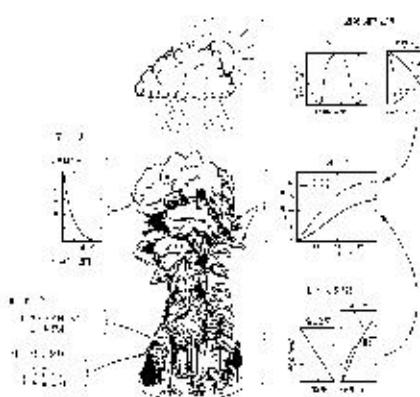

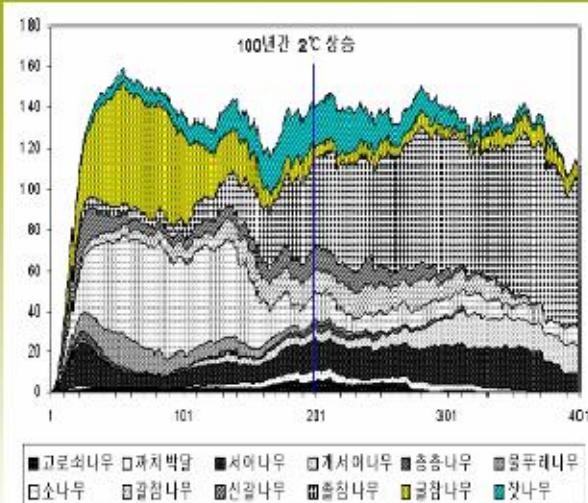

Present climate

1 °C increase

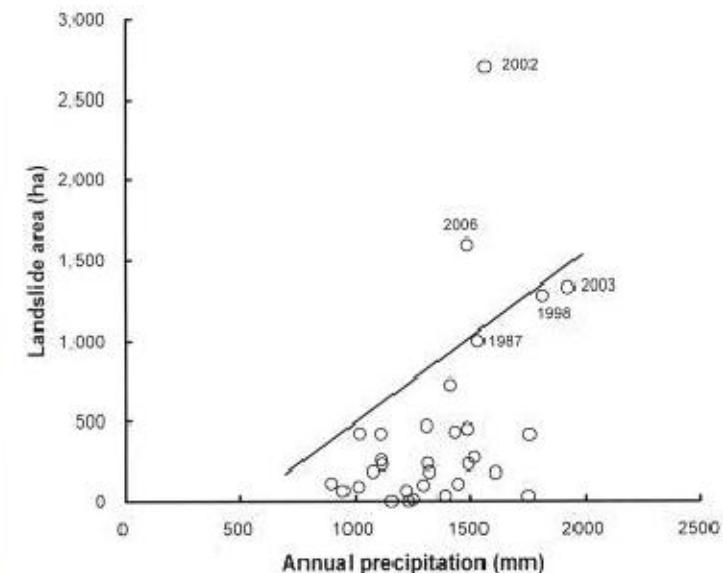

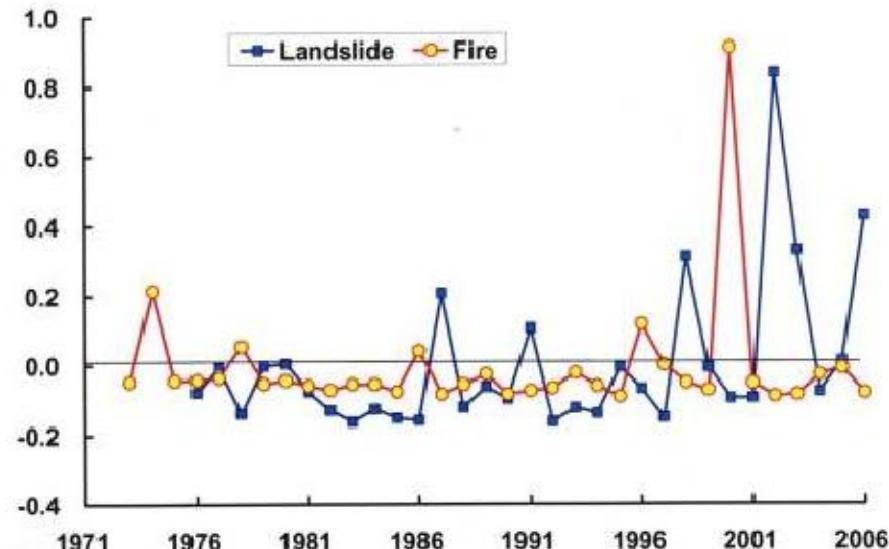

2 °C increase

- Increase: *Q.serrata*, *Carpinus* sp.
- Decrease: *P.koraiensis*, *Q.mongolica*
- Productivity maintained

- Increase: *Q.serrata*, *Carpinus* sp.
- Decrease: *P.koraiensis*, *Q.mongolica*
- Productivity declined

# Forest Disasters: Fire, Landslide

- Extreme events will be increased
- Amplified effects among disasters
- Relationship with vegetation change  
(Pine forest distribution, forest fuel)

# Insects, Pests and Disease

## Increased number of generations

Jour. Korean For. Soc. 91(2) : 149 - 155. 2002  
韓國林學會誌 91(2) : 149 - 155. 2002

### Increase in the Number of Generations in *Dendrolimus spectabilis* (Butler) (Lepidoptera : Lasiocampidae) in Korea<sup>1</sup>

Tae-Sung Kwon<sup>2\*</sup>, Young-kyu Park<sup>3</sup>, Ki-Seok Oh<sup>3</sup>, Young-Dae Kwon<sup>3</sup>, Sang-Chul Shin<sup>2</sup>, Chul-Su Kim<sup>2</sup>, Ji-Du Park<sup>1</sup> and Hoi-Poong Lee<sup>1</sup>

## Outbreaks : 爆發

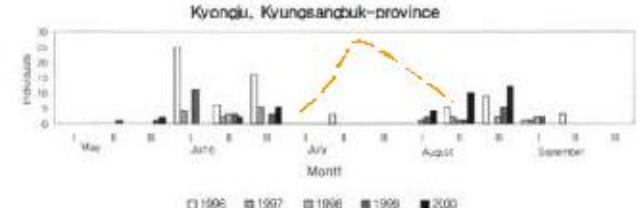

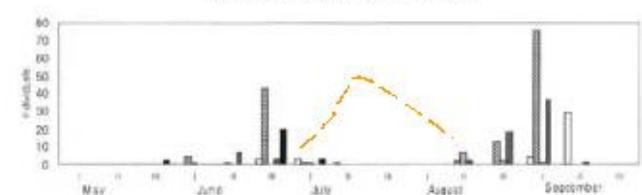

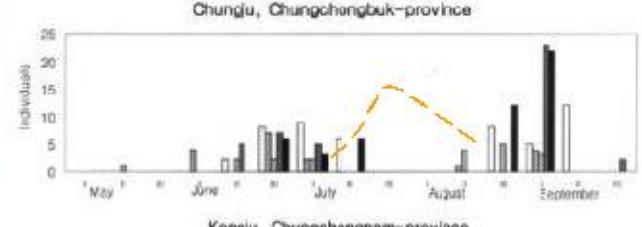

Figure 1. Emergence of adults of *Dendrolimus spectabilis* from 1996 to 2000 in Korea.

Other alien pests and disease  
oak wilt disease, pine nematode  
and so on

# What we can do to respond the climate change?

1

.....→ 온실가스 저감(**Mitigation**)

2

.....→ 기후변화 적응(**Adaptation**)

3

.....→ 피해를 받아들임(**Suffering**)

# Whitch forest sectors are vulnerable in Korea?

- Heavy Rainfall in summer
- Occational extreme climate: eg. drought
- Raipid increase of Temp. and CO<sub>2</sub>

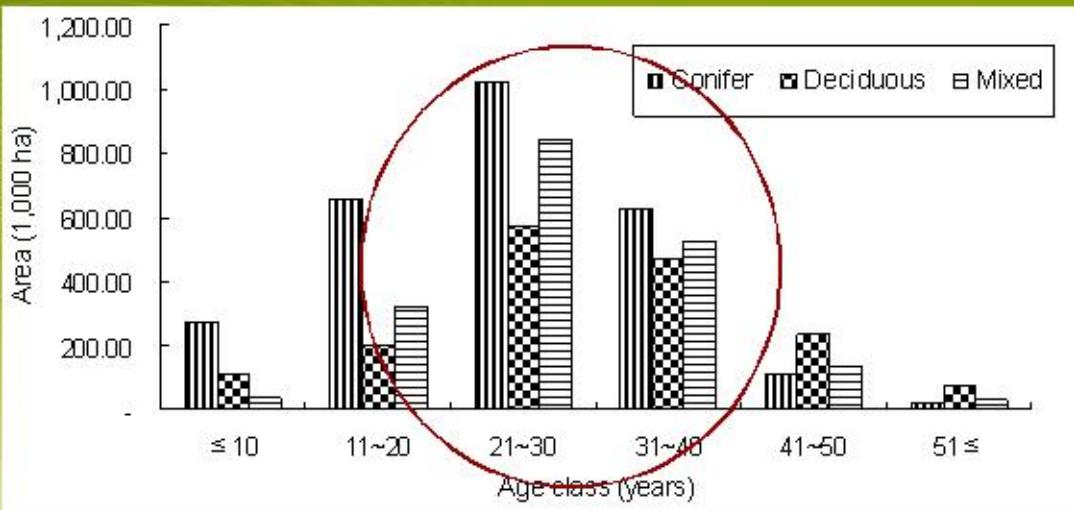

- Topographically steep
- Concentrated age class
- Unsuitable species to future climatge
- Thick forest stand: increased fuels,  
increased water demand
- Fragmented landscape
- Possibly increase of invasive alien  
species

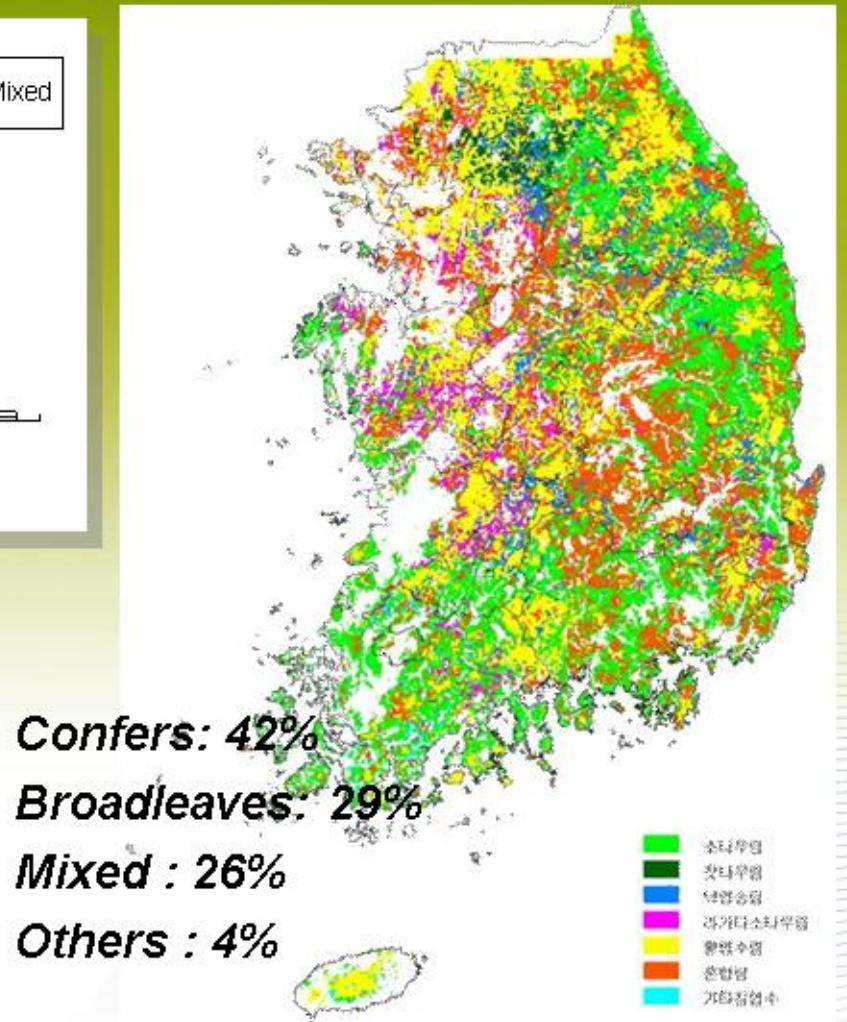

## Vulnerable area

- **Forest disasters**
  - Landslide
  - Forest fire
- **Forest health**
  - pests and disease
  - decline
- **Biodiversity loss**
- **Other ecosystem services change**

# Forest Types and Age Distribution

- Most of the forests are 20 to 40
- Old-growth or virgin forests are rare

# Capacity Building of Climate Change Adaptation

**1** Scientific understanding and monitoring

**2** Impact and vulnerability assessment

**3** Biodiversity conservation

**4** Maintenance of forest productivity

**5** Forest water resource conservation

**6** Landslide control and early warning system

**7** Fire control system and fuel management

**8** Forest pest management

Monitoring and assessment

Maintenance of biodiversity and productivity

Reducing risks of disasters and maintenance of forest health

## Climate change adaptation measures *proactive*

- Forest biodiversity conservation
  - inter-linkage of ecosystems, PA, restoration
  - in/ex situ conservation of vulnerable genes, species and communities
- Prevention, early warning and suppression system of forest disasters
- Control and quarantine system of forest insects and plant pathogens
- Forest management: diversification of age class and species
- Thinning for forest health and water conservation
- Maintaining forest productivity by silvicultural methods and soil conservation

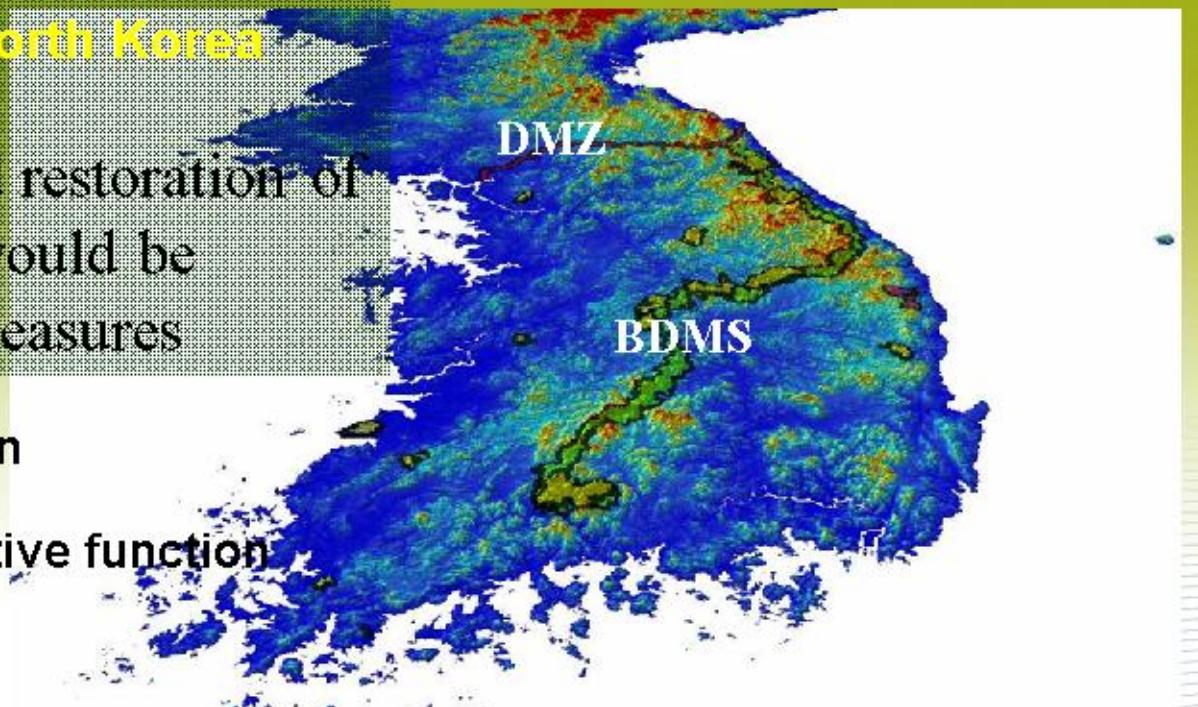

# Synergistic adaptation measure

- Baekdudaegan Mountains System (BDMS)
- DMZ/CCZ area
- Degraded forests in North Korea

Networking of PAs and restoration of degraded ecosystems would be important adaptation measures

- Biodiversity Conservation
- Forest health and protective function
- GHG mitigation
- Other ecosystem services  
- tourism, fresh water

KFRI, 2006

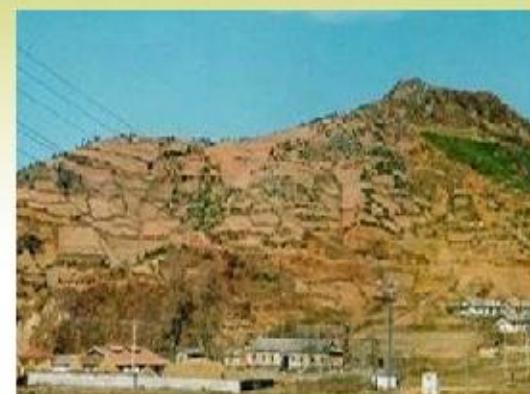

**Quarry (mining field)**

**Forest road**

**Paddy field**

**North Korean Forest**

**Forests in coastal area and sand dune**

*Thak you!!*
